

## Section 17 – SAMBA

### Answers

1. A
2. b  
samba-windbind is used when you want the Linux host to join an Active Directory domain. For basic file sharing it is not strictly needed
3. c
4. b. They are used only if you intend to use the nmbd naming service daemon
5. a
6. a  
By changing the netbios name in the `/etc/smb.conf` file
7. b  
You can do this by adding `hosts allow 10.240.3.` (without the asterisk)
8. b  
You will also have to add it to SAMBA users using the `smbpasswd -a` command, and set its password
9. a  
Using cups options = raw
